CityCare AI Module Evaluation

This document details the comparative performance of NLP models for issue classification.
The evaluation measures precision, recall, and F1-score across candidate architectures.

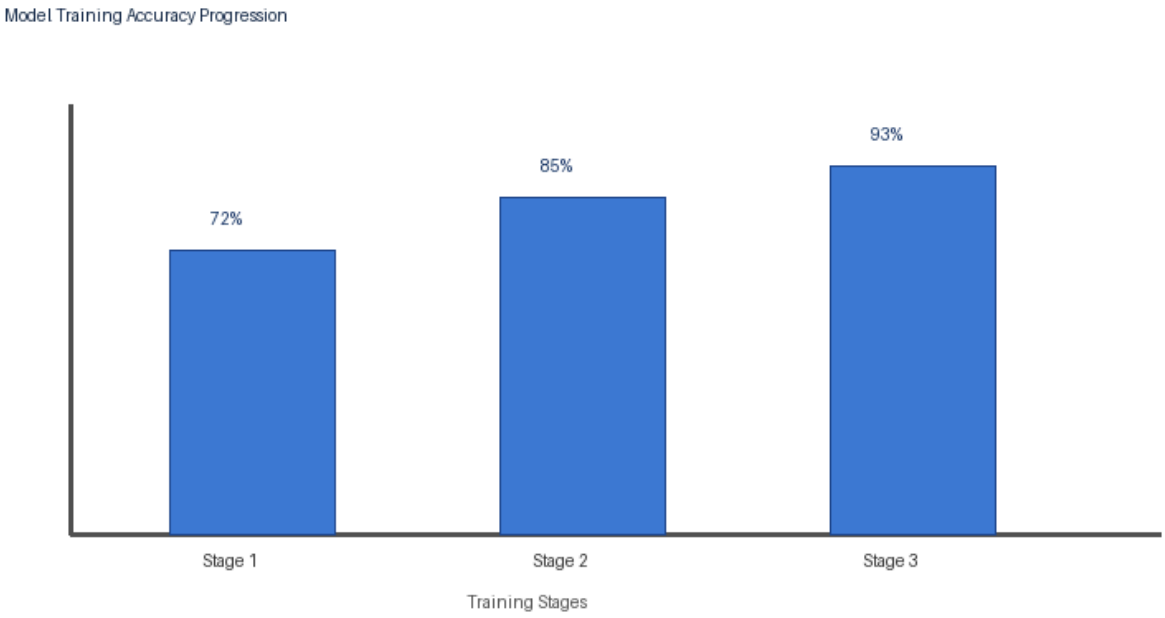

Model Performance Comparison

Model	Precision	Recall	F1-Score
Model A	0.82	0.80	0.81
Model B	0.95	0.93	0.94
Model C	0.78	0.85	0.81

Summary of findings:
Model B achieves the highest F1-score of 0.94, outperforming Model A (0.81) and Model C (0.81).
Model B is recommended for automated issue triage.

Training Stage Progression and Accuracy

The graph below depicts the training accuracy progression across three consecutive training stages.

The trend demonstrates steady accuracy growth from Stage 1 (72%) up to Stage 3 (93%). Stage 3 exhibits the peak accuracy observed across all experiments.
